MELANIN

# Scientists Deliver Melanin To Space Station To Test It's Protective Abilities Against Radiation

BY TRU DREADZ CHIEF EDITOR ON NOVEMBER 4, 2019

If Melanin “has no special benefits” like some people like to say, then why is it continuously one of the top focuses of modern scientific research? Why would they want to use Melanin to protect spacecraft worth hundreds of millions of dollars if all it did was “make people’s skin different shades of brown”?

Photo Credit: John Hopkins University – Radamés J.B. Cordero (right) and his research collaborator Quigly Dragotakes hold samples of melanin derived from *Cryptococcus neoformans* similar to the materials that will be sent into space.

According to a report by John Hopkins University (<https://hub.jhu.edu/2019/11/01/melanin-space-study/>) rockets loaded with "a composite of fungal melanin and polymers (<https://hub.jhu.edu/2019/11/01/melanin-space-study/>)" were scheduled to deliver the Melanin to the International Space Station for further research on it's protective abilities against radiation.

The report goes on to say: "When the massive Antares rocket lifts off from Wallops Flight Facility on Virginia's Eastern Shore on Saturday morning, it will carry with it a payload of tiny, fungus-grown biomaterials that (<https://hub.jhu.edu/2019/11/01/melanin-space-study/>) (<https://www.jhsph.edu/faculty/directory/profile/3551/radam-s-j-b-cordero>) Radamés J.B. Cordero has spent the past four years developing and studying intensely. The material, a composite of fungal melanin and polymers, will be delivered to the International Space Station in Earth's low orbit, where it will be tested for its ability to protect against space radiation. The results of those tests could inspire new ideas about how to protect humans from harmful radiation on Earth and in outer space. (<https://hub.jhu.edu/2019/11/01/melanin-space-study/>)"

It's ironic that while so many (ignorant) people love to degrade and downplay the magnificence of Melanin, top scientists around the world are diligently and desperately looking for ways to utilize this substance for a variety of campaigns, usually military or technology orientated.

While normally Melanin is about \$400 a gram, Cordero has found a much more cost effective way to gain hold of this substance, that is to grow it.

John Hopkins University reports, "This is the first time melanin has been sent to space for testing, partly because the material is extremely expensive to produce, with a gram typically costing roughly \$400. Cordero's work centers on a form of melanin grown in the environmental fungus (<https://hub.jhu.edu/2019/11/01/melanin->

space-study/) *Cryptococcus neoformans* (<https://hub.jhu.edu/2019/11/01/melanin-space-study/>), which researchers expect may provide a far more cost-effective "factory" for melanin and may even provide additional protective benefits. (<https://hub.jhu.edu/2019/11/01/melanin-space-study/>)" They are essentially organically farming melanin.

So what happens if the report comes back that their Melanin produced from Cordero's "cost-effective factory" will be an excellent material for all further space navigation programs? Melanin will be in a much higher demand. Will there actually begin to be massive factories opening up, producing Melanin to keep up with the demand?

Not only that, doesn't that make you look at yourself and your own Melanin differently? The substance that makes your skin brown is a candidate to be used as a protectant against space radiation.

Still don't believe there's "magic" in your Melanin? If you don't, you should.

**Hubert Baird**

Melanin is an Abundant natural element in our solar system- further validates the fact that without it it impossible for the essential to life

So that's what they're doing with all the missing people...

Wow, thanks for the research, this information correlates exactly with my social thriller novel titled "BLK Harvest." which is almost ready for release

Let's also not fail to recognize that since melanin is so expensive to produce, they are looking at ways to produce it inexpensively. Put it together with the large number of melanated people missing and dying, and also add in that they still see us as subjects and experiments (as opposed to humans), and you'll understand their wickedness even more.

That's how they going to facilitate the Need. They are doing it NOW, many people are coming up missing and dead. Mysteriously donated to science.

Melanin contains 6 protons, 6 neutrons, and 6 electrons- stated as 666 and known as Carbon 12

**Teah Mack**

And what if they start killing us for our melanin or because our organs have melanin in them which makes them stronger...then where do we stand if we possess something they can make money off of...go figure... get a gun license and dont be found alone anywhere!!!

Adrian Lindsay we all need to unify and protect ourselves and spread awareness like I've been doing everyday and Don't focus on the negative aspects of LIFE. It only takes a second to stoop to another person level and get taken off your square we must remain vigilant and Stay focused and in due time our blessing will arrive.

In a more perfect world, this type of uneducated, ignorant and fear mongering style of journalism would be against the law. There are many, many different varieties of melanin and that which is plant based is NOT THE SAME as that which produces skin color in people

TRUDREADZ

If these Wicked minded scientist make and create their own melanin artificially then hopefully they won't need us to kidnap
